Autism Services

OUR SERVICES

Developmental or Neurological Evaluations

An appointment with a NeurAbilities developmental pediatrician or neurologist is an important first step in understanding your loved ones symptoms, including concerns about learning, behaviors, and developmental milestones.

Psychological Assessments

Our psychological services assist in creating treatment plans, formulating goals for individual educational plans (IEP), and monitoring the benefit of interventions. Assessments are customized to meet individual needs.

Applied Behavior Analysis (ABA)

We offer 1-to-1 ABA services in home, clinic, and community settings, customized to meet the needs of each individual. With three distinct programs available to address a variety of skills and goals, children will benefit from a personalized approach with measurable goals to track outcomes:

EIBI – Early Intensive Behavioral Intervention

This early childhood development program is ideal for toddlers 14 months to 5 years with an autism diagnosis. Intensive therapy is recommended 25 to 40 hours per week to address developmental delays, cognitive concerns, communication, social and emotional functioning.

Comprehensive ABA

This generalized program provides therapeutic interventions for children up to age 11 to address multiple treatment areas in structured therapy sessions, typically 25 to 35 hours per week.

Focused ABA

This program is appropriate for school-aged children who need therapy to address a specific skill or acute treatment goal. This targeted therapy program is recommended for children as young as 3 years old for 10 to 25 hours per week.

Long term data has proven that early intervention services for children with autism results in better long term outcomes.
